Summary

I have been building whole products for more than five years, from the screen to the server. At Tippi I am a minority partner and I handle payments: Mercado Pago, the Clover app, and the terminal on the INI SDK. I started FLIA-IT with friends. I already have the University Programmer Analyst degree and I am finishing a B.S. in Systems at UNLP. The thesis is SIAT.

Skills

Payments: Mercado Pago (Checkout Pro, Bricks, OAuth, webhooks), Clover SDK, INI card-present SDK, POS, QR, NFC, Apple Wallet, Google Wallet

Languages: TypeScript, JavaScript, Python, Kotlin, Java, SQL, Bash

Frontend: React, Next.js, SvelteKit, tRPC, Tailwind CSS, Expo

Backend: Node.js, Express, FastAPI, Django, NestJS, REST

Data: MongoDB, FerretDB, PostgreSQL, MySQL, Redis

Infrastructure: Docker, Linux, Git, VPS, AWS, n8n, BullMQ, Vercel

Experience

Minority partner and full-stack developer, Tippi

2023 – Present. Argentina

Restaurant platform already in production: tips, staff, digital menu, gift cards, and QR codes. Repository admin. 3,000+ commits.

- I started it, and I still write most of the code. The current stack is Next.js, React, TypeScript, tRPC, Express, and MongoDB, with FerretDB on the server.
- Employee payouts go through Mercado Pago, with Checkout Pro or Bricks, OAuth, and webhooks. The guest pays on Mercado Pago or on our site, and the same employee receives the money.
- The Clover terminal app is in Kotlin. The POS reports the charge even if the app is closed. The tip is assigned to the person who served the table, the review QR is theirs, the merchant provisions itself, and the receipt prints on the thermal printer.
- On the INI terminal the amount comes first and the tip second. INI sends a webhook (payment, rejection, refund, or void) and we reconcile with an external reference. We do not use the value returned by the SDK screen.
- I also look after the server: Docker, the VPS, the move from MongoDB to FerretDB, Strapi, Clerk, and n8n.

Co-founder and full-stack developer, FLIA-IT

2025 – Present. Argentina

We started the company with friends. Several products at once. I admin the organization. 800+ commits.

- Collect&Go is loyalty for shops. The customer earns points with a QR or an NFC tap and saves the card to Apple Wallet or Google Wallet, without installing an app. It has a landing page, a scanner PWA, and a FastAPI with MongoDB.
- trip-os is a travel app meant for the phone, with an agent that plans the trip. API, Postgres, MinIO, Meilisearch, and Caddy, all on Docker.
- Campaign Maker sends WhatsApp campaigns on Meta's Cloud API: templates, contact upload, BullMQ and Redis queues, webhooks, and retries when Meta rate-limits.
- There is also client work: Granja Don Alvaro (a Next.js shop, Spanish and English), Looká (virtual try-on with Django, React, WebRTC, and the Decart SDK), LCN VTG (a vintage catalog that opens WhatsApp with the item already written), and Plantaria (a landing page that writes on WhatsApp).

Backend developer, TheBroos Agency

2022 – 2023. Argentina

Web agency.

- APIs in Python and FastAPI, deployed on AWS and VPS.

Thesis

SIAT, B.S. in Systems thesis

2026 – Present. *midusi*, Universidad Nacional de La Plata

I am building it now. It is a computer-vision system for traffic analysis.

- The base is a FastAPI, a SvelteKit frontend, PostgreSQL, MinIO, and a worker that runs YOLO. Five services on Docker.
- In this stretch I took the production deploy, storing the video, and getting the result out as H.264.

Personal projects

- La Justa is a clothing shop in Next.js: collections, made-to-measure pieces, a size guide, and Mercado Pago checkout.
- Tura is a reading app. I built it with Expo and a self-hosted Supabase.
- The trading bot reads live Binance data, ranks markets, and trades with a mandatory stop and a genetic learner. The money is fake: it cannot place a real order.
- For a bot that sells credits I built a multi-tenant panel in Next.js and MongoDB, to follow the chats with customers.
- Buenos Aires Crea has a Next.js frontend and a FastAPI with SQLAlchemy.
- Puente is a Flutter app for people with visual and hearing disabilities. It shows large text, speaks it, and vibrates. A family member enters the data. It does not move money.

Education

University Programmer Analyst. Universidad Nacional de La Plata, School of Computer Science. Degree completed.

B.S. in Systems. Universidad Nacional de La Plata, School of Computer Science. November 2020 – present. Thesis in progress. About to graduate.
